

Classroom practice 1 - Control flow instructions

Exercise 1.1 - Students grades

We want to write a program that is able to tell a student if he passed a certain school subject.

The program should ask at the beginning for the name of the school subject, then it must ask the number of tests done.

After that, it should ask the note of each test, calculate the average and then tell the student if he passed or not the subject.

The pass grade is 4.

Use all what we have seen so far in order to solve the problem.
