

Problem Set 2 - Getting started

Hello students!

The goal of this problem-set is to dip your toes into programming.

You will be asked to solve a few assignments, read carefully the description, and try to apply what you learned during the lectures.

Starting from the programs viewed in the last problem-set, develop the following programs.

Assignment 2.1 - Welcome (optional)

Write a program that generates the output shown below. It must respect the formatting below.

```
Hello students,  
welcome to SUPSI and  
welcome to Introduction to Computer Programming  
of the Bachelor in Data Science.
```

Assignment 2.2 - Personal data (optional)

Write a program that asks for someone's data, such as *first name*, *last name*, *address*, and *year of birth*. Then the program must calculate the age of the person (take only the year into account), and print all the information as follows:

```
First Name: Foo  
Last Name : Bar  
Address: Via la Santa 1, CH-6962 Lugano-Viganello  
Year of birth: 1991  
Age: 29
```

Steps to follow:

1. Declare four variables to contain the required data
2. Use the *input* function to ask and read the required data
3. Calculate the age
4. Print the resulting data to screen

Assignment 2.3 - Simple math (optional)

Write a program that asks for three integer numbers and then shows the result of the subtraction of the third number from the sum of the first two numbers.

Assignment 2.4 - Bank transactions (optional)

Write a program simulating the transaction of a bank account. The transaction can be a withdrawal (negative) or a deposit (positive).

Start by setting the initial account balance.

Then the program asks for an operation. At this point, the user inserts a value (e.g., -1000), and the updated value is printed back to the user.

Output example:

```
Initial account balance: CHF 3429
```

```
Perform an operation: -150
```

```
You moved CHF -150, your new balance is CHF 3279
```
